

What is the operation management of pumped storage power stations?

The operations management of pumped storage power stations mainly includes power station operation, multi-energy complementarity, digital management system, profitability, and electricity consumption adjustment.

What is a pumped storage power station?

Pumped storage power stations partner with stakeholders and share relevant information during the operations management processes, which facilitates the integration of various types of renewable energy power stations into a cohesive "multi-energy complementarity" entity [ 3, 11, 22, 31 ].

Should pumped storage power stations be managed solely?

Interviews revealed that it is insufficient to solely focus on the operations management of pumped storage power stations, and there is also a need to emphasize complementarity and collaboration with other power stations of clean energy.

How pumped storage power stations can improve energy consumption adjustment?

By enhancing the operations management of pumped storage power stations, and promoting coordination with other renewable energy stations, as well as advancing digital management system construction, it is ensured that the pumped storage can yield stable returns and effectively fulfill its role in electricity consumption adjustment.

Are pumped storage power stations multi-energy complementarity?

Considering the strong interconnection among different types of renewable energy power stations and pumped storage power stations and with power grid companies, it is imperative to view the operations management of pumped storage power stations from a multi-energy complementarity perspective, which involves various stakeholders [ 29 ].

Are pumped storage power stations a large-capacity power bank?

Typically, the construction of pumped storage power stations is large-scale and has a long implementation period, serving as a "large-capacity power bank" in the power system [ 7 ].
