

# How to fix the power supply without battery slot

How do I fix a faulty power supply?

If it is set it to stock speeds. Also can try a motherboard BIOS reset, unplug system, remove the CMOS battery and hold in the power button for about 15 seconds. Plug things back in see if it works better. If it still does the shut off, try another power supply. Corsair CX is probably the cheapest good quality one. Sounds like a power supply issue.

How do you remove a power supply from a PC?

Unscrew the mounting screws on the back of the case which hold the power supply in its housing. Place the screws in a handy location. Gently remove the old power supply from the case. This is usually a simple process, but if there is little room in your PC, it may be necessary to remove other components to get the power supply out.

How do I know if my power supply is failing?

Here're a few signs you will notice when your power supply is failing. The first sign of a failing power supply is a PC that doesn't boot up at all. When you press the power button on your PC, you won't get any kind of reaction--no fans spinning, no LED lights and no PC boot. At this point, you may not straight pinpoint the PSU for failure.

Why is my power supply not working?

If you're experiencing issues with your power supply, it's important to understand whether the problem is with the AC side or the DC side. Modular power supplies, which allow you to remove and replace individual components, can be easier to repair than non-modular power supplies.

What happens if a power supply fails?

Power supplies that fail can damage other components in your computer, especially the motherboard. Sometimes, a failing power supply can continue to boot the system, causing only minor lockups and shutdowns. If this is the case, you should try to rule out other problems before replacing the power supply.

What to do if a CMOS battery won't work?

Also can try a motherboard BIOS reset, unplug system, remove the CMOS battery and hold in the power button for about 15 seconds. Plug things back in see if it works better. If it still does the shut off, try another power supply. Corsair CX is probably the cheapest good quality one. Sounds like a power supply issue. Is anything overclocked?
