What is a lithium ion battery?

A Li-ion battery consists of an intercalated lithium compound cathode (typically lithium cobalt oxide,  $\text{LiCoO}_2$ ) and a carbon-based anode (typically graphite), as seen in Figure 2A. Usually the active electrode materials are coated on one side of a current collecting foil.

What is the ideal cathode for a lithium ion battery?

Thus, an ideal cathode in a Li-ion battery should be composed of a solid host material containing a network structure that promotes the intercalation/de-intercalation of  $\text{Li}^+$  ions. However, a major problem with early lithium metal-based batteries was the deposition and build-up of surface lithium on the anode to form dendrites.
