I want to extract the first (or last) n characters of a string. This would be the equivalent to Excel"s LEFT() and RIGHT().

I have used r in my own console apps where I am testing out some code and I don"t want to see text scrolling up my screen, so rather than use n after printing out some text, of say, a frame rate (FPS), I will printf("%-10dr", fps); This will return the cursor to the beginning of the line without moving down to the next line and allow me to ...

The modes r, w, x, a are combined with the mode modifiers b or t. + is optionally added, U should be avoided. As I found out the hard way, it is a good idea to always specify t when opening a file in text mode since r is an alias for rt in the standard open() function but an alias for rb in the open() functions of all compression modules (when e.g. reading a *.bz2 file).

By using the merge function and its optional parameters:. Inner join: merge(df1, df2) will work for these examples because R automatically joins the frames by common variable names, but you would most likely want to specify merge(df1, df2, by = "CustomerId") to make sure that you were matching on only the fields you desired.
